

2a.

The purpose of my program is to make a humorous quiz mirroring the effect of a BuzzFeed quiz. BuzzFeed is a new media company that does an array of things like youtube videos, websites, etc. One of their very well known things are their quizzes because they are fun and casual. Mine was a “How lame Are You?” quiz. It consisted of a point system and a if and else program to when the person answers a set of questions.

2b.

When making the program the most important part was creating good funny questions that would make the user finish the actual quiz. Also Haze in my class ended up helping me when I got confused. Another main part was setting up the point system. If the point system didn't work the quiz wouldn't make any sense because the question the quiz is titled as wouldn't be answered.

2c.

```
#1st question

print('1st question')

print('How old are you?')

points = 0

age = int(input())

if age > 0 and age <= 15:

    points += 1
```

How this code helped me reach my intended purpose was that first it asked the question and depending on the response they got a point or not. Then it tell them how many points they currently have. This works well because the quiz is how many points out of 5 the user gets is the level of lame they are or pathetic. This is both funny and fun to do and see what the outcome is.

2d.

```
if facehits > 3 and SignificantOthers <= 100:

points += 1
```

This is an abstraction because it says exactly what constitutes as a point. This makes sure the point is given only within a certain boundary. This makes sure the program runs smoothly.
